According to our (Global Info Research) latest study, the global Individual Pitch Bearings market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Individual pitch bearings are pitch bearings used in wind power individual pitch systems. Against the backdrop of the gradual upgrading of domestic wind turbine units towards large-scale, long blade, and intensive development, the market demand for pitch bearings as their core components continues to increase. The variable pitch bearings used in traditional variable pitch technology can no longer meet the requirements of upgraded wind turbines. Therefore, the individual variable pitch bearings used in individual variable pitch technology have emerged as a key component for effectively reducing wind turbine loads and achieving lightweight wind turbines. Individual variable pitch bearings can achieve three-dimensional rotation, with stronger control and driving force, which can make the force situation in various areas of wind turbine blades consistent. It is an important direction for the future upgrade of variable pitch bearings.
