Abstracts

An inductive proximity sensor is a sensing device that detects metal targets using electromagnetic energy and without contact. The sensing range of an inductive proximity sensor changes based on the type of metal being detected. Since non-metallic substances such as dirt and liquid do not interfere with detection, an inductive proximity sensor operates in wet or dirty conditions.

According to our (Global Info Research) latest study, the global Inductive Proximity Sensors market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
