Induction Hardening Systems are specialized equipment used to increase the surface hardness and wear resistance of metal components through a process of induction heating followed by rapid cooling (quenching). This technique involves generating a high-frequency electromagnetic field that induces heat in the surface layer of the metal, raising its temperature quickly and uniformly. The rapid cooling locks in the hardness by altering the metal's microstructure, creating a tough, wear-resistant surface while maintaining a ductile core. Induction hardening is widely used in industries such as automotive, aerospace, and manufacturing for components like gears, shafts, and bearings, enhancing their performance and extending their lifespan.
