Abstracts

The global Induction Heating Hot Tobacco Product market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Hot tobacco is also known as heated tobacco or heat-not-burn tobacco or hybrid tobacco. Heated Tobacco Products (HTPs) produce aerosols containing nicotine and other chemicals, which are inhaled by users through the mouth. These use specific tobacco products to be heated at temperatures below combustion levels. Hot tobacco products release flavors with nicotine and allow the user to enjoy tobacco without combustion. Induction heating is a process where electrically conductive materials, metals for example, are heated through electromagnetic induction. The metal heating element is placed in the center of a metal coil shaped like a spring, so that the coil and the heating element don't touch one another at all. An electric current is passed through the coil, which creates the magnetic field at its center, and that field makes the metal element at the center generate heat.
