## Abstracts

According to our (Global Info Research) latest study, the global Inductive Sensor market size was valued at USD 1133.6 million in 2023 and is forecast to a readjusted size of USD 1936.8 million by 2030 with a CAGR of 8.0% during review period.

An inductive sensor is a device that uses the principle of electromagnetic induction to detect or measure objects. An inductor develops a magnetic field when a current flows through it; alternatively, a current will flow through a circuit containing an inductor when the magnetic field through it changes. This effect can be used to detect metallic objects that interact with a magnetic field. Non-metallic substances such as liquids or some kinds of dirt do not interact with the magnetic field, so an inductive sensor can operate in wet or dirty conditions.
