Industrial boiler cleaning is designed to safely remove all deposits from the boiler. In the high pressure boiler, copper and magnetite are removed. Hard adhering scales such as calcium carbonate are usually removed in low pressure boilers.

According to our (Global Info Research) latest study, the global Industrial Boiler Cleaning Services market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Regular cleaning of industrial boiler tubes will improve the economic and technical performance of the boiler, reduce operating costs and fuel consumption, and promote a longer lifespan of the heating system. Annual boiler tube cleaning will dissolve and remove rust, magnesium, calcium and other deposits while keeping boiler components safe. An alkaline cleaning solution consisting of surfactants and trisodium phosphate is used prior to boiler cleaning. These solutions eradicate oil-based compounds from pipe surfaces and remove materials that could interfere with boiler cleaning chemicals and deposits.
