The global Industrial Cleaning and Surface Treatment Services market size is expected to reach \$ 5953 million by 2032, rising at a market growth of 4.5% CAGR during the forecast period (2026-2032).

Industrial cleaning and surface treatment services refer to the professional removal of various contaminants or coatings formed on the surfaces of industrial production equipment, components, and materials during production, processing, storage, or use through physical, chemical, biological, or electrochemical methods. This aims to achieve specific cleanliness requirements or further alter the surface's physicochemical properties, providing a suitable foundation for subsequent processing, manufacturing, coating, electroplating, welding, and assembly processes. Ultimately, this achieves goals such as energy conservation and emission reduction, safe and stable production, improved product quality, extended equipment lifespan, ensured production safety, and compliance with environmental protection requirements. Surface treatment, on the clean substrate provided by cleaning, uses technical means to endow the material surface with new mechanical, protective, decorative, or special functions, making it an indispensable and crucial link in the entire manufacturing chain.

This industry has broad prospects and is currently in a critical period of transformation from traditional services to modern, high-value-added industries. The core driving force comes from the green transformation and precision upgrading of global manufacturing, as well as the increasing demands for production efficiency and equipment reliability.

The future development of the industry will clearly focus on 'greening, intelligentization, high-end development, and service orientation': greening is reflected in the widespread adoption of pollution-free and low-emission technologies such as environmentally friendly cleaning agents and dry cleaning; intelligentization is manifested in automated cleaning equipment, robotic operations, and predictive maintenance and process

optimization integrated with the Internet of Things and big data; high-end development involves expanding services to precision manufacturing and strategic emerging industries such as semiconductors, new energy, and aerospace; and service orientation is deepening from single cleaning operations to providing comprehensive solutions and full lifecycle equipment maintenance management. The global market size is expected to continue to grow, and technological innovation and professional service capabilities will become the core competitiveness of enterprises.
