The global Industrial Control Systems for Mining market size is expected to reach \$ 7724 million by 2032, rising at a market growth of 8.4% CAGR during the forecast period (2026-2032).

Industrial Control Systems for Mining refer to integrated automation and control platforms used to monitor, control, and optimize mining operations across extraction, processing, material handling, and auxiliary systems. In 2025, the average global price of mining industrial control systems is approximately US\$0.62 million per system, with global annual sales volume estimated at around 6.85 thousand systems. The industry typically operates at a gross margin range of 35%-55%, supported by system integration complexity, mission-critical reliability requirements, harsh-environment design, and long project lifecycles. The supply chain includes upstream components such as PLCs, DCS controllers, industrial PCs, sensors, actuators, drives, networks, and control software; midstream suppliers focus on system design, configuration, integration, cybersecurity hardening, commissioning, and lifecycle services; downstream users include surface and underground mines, mineral processing plants, concentrators, and mining operators across coal, metals, and non-metallic minerals. Mining industrial control systems are increasingly positioned as the backbone of digital and autonomous mining strategies, driven by labor shortages, safety requirements, and the need for operational efficiency under volatile commodity cycles. Demand is shifting from basic control toward integrated platforms combining process automation, remote operation, and real-time data visibility. Leading suppliers differentiate through system reliability, cybersecurity capabilities, scalability across mine life cycles, and deep domain expertise in mining processes.
