Abstracts

The global Industrial CT Inspection Machine market size is expected to reach \$ 2369 million by 2032, rising at a market growth of 10.0% CAGR during the forecast period (2026-2032).

An industrial CT inspection machine is an advanced non-destructive testing device that uses X-ray computed tomography to examine industrial products. By scanning the object from multiple angles with high-energy X-rays, it captures cross-sectional images of the internal structure and reconstructs them into a 3D model using computer algorithms. This enables clear visualization of internal defects such as cracks, voids, foreign objects, or dimensional deviations. Widely used in industries such as automotive, aerospace, electronics, and materials science, industrial CT systems enhance quality control, accelerate product development, and ensure structural safety. In 2025, global Industrial CT Inspection Machine sales reached approximately 2,850 Units, with an average price of 421 k US\$/Unit.

For a long period, the adoption of industrial computed tomography, or industrial CT, was largely confined to closed-loop and specialized applications such as defense and aerospace, university research, and materials laboratories, mainly because systems often cost several million to more than RMB 10 million, while also offering relatively slow scanning speeds and requiring complex software operation. In recent years, however, the global nondestructive testing, or NDT, market has continued to expand. As one of the most technologically advanced segments within the NDT industry, industrial CT has achieved a significantly higher compound annual growth rate than conventional ultrasonic testing and two-dimensional X-ray inspection.

Among all downstream growth drivers, demand from new energy batteries, including

traction lithium-ion batteries and energy storage batteries, has expanded the fastest. Lithium-ion batteries are high-energy-density electrochemical systems with highly complex and sensitive internal structures. Even micron-scale metallic contaminants, slight deviations in electrode overhang, minute pores, or cracks in tab welds may trigger thermal runaway during repeated charging and discharging cycles, potentially resulting in serious fires or explosions. Industrial CT enables nondestructive three-dimensional inspection of these internal defects and has therefore become increasingly important in battery R&D, process validation, quality control, and production-line inspection. The automotive industry, traditionally the largest application market for nondestructive testing, has also undergone a fundamental shift in inspection requirements amid electrification and lightweighting. One of the most representative developments is integrated die casting, promoted by automakers such as Tesla and BYD, which consolidates dozens or even more than one hundred individual components into a single large aluminum alloy casting. These large structural components are highly complex in shape and often have uneven wall thicknesses. During rapid cooling and solidification, they are susceptible to hidden internal defects such as porosity, shrinkage porosity, cavities, and internal cracks. Conventional surface inspection and two-dimensional radiography are often insufficient to accurately locate and quantify such defects, creating strong demand for high-energy and large-format industrial CT systems.

Demand from the electronics and semiconductor industry has also risen sharply in recent years. As Moore's Law approaches its physical limits, the semiconductor industry is increasingly shifting toward heterogeneous integration and advanced 2.5D and 3D packaging technologies in the post-Moore era, including CoWoS packaging and chiplet architectures. Semiconductor devices are therefore no longer based on simple planar structures, but instead rely on thousands of microbumps and through-silicon vias, or TSVs, to achieve ultra-high-density vertical interconnections in three-dimensional space. These structures create new inspection challenges involving voids, cracks, misalignment, incomplete interconnections, and interface defects, which are difficult to identify through conventional two-dimensional X-ray inspection. High-resolution industrial CT is consequently becoming an increasingly important tool for advanced packaging development, failure analysis, process optimization, and production quality control.
