According to our (Global Info Research) latest study, the global Industrial Deaerators market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Industrial grade boilers are a major investment, making it extremely important to extend their lives and maintain their efficiency for as long as possible. Corrosion is a major factor in the failure of boilers, which is where the deaeration process comes in. Deaeration involves oxygen removal, as well as carbon dioxide removal, thus extending the life and efficiency of a boiler system – it is very pertinent that the makeup water entering a boiler is free of these dissolved gases. The major area of application for deaerators can be found within a boiler plant and boiler feed water systems. Deaerators are used in industrial applications such as power plants and chemical process industries to reduce corrosion and extend the life of a steam-generating boiler. A deaerator achieves this task by reducing the level of dissolved oxygen and carbon dioxide in the feedwater, which in turn reduces the amount of corrosive compounds within the steam system over time. Deaerators also reduce the need for water treatment chemicals, such as an oxygen scavenger. In addition to reducing dissolved gasses in the feedwater to reduce corrosion damage, a deaerator also raises the temperature of the feedwater before it enters the boiler, thus requiring less fuel for the boiler to heat the water hot enough to produce steam. As a result, the boiler system performs better, is more efficient overall, and helps maintain operating costs.
