Abstracts

The global Industrial Dielectric Heating Equipment market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Dielectric heating is a generic term that includes both microwave and radio frequency heating. There are two main mechanisms in which heat is produced in dielectric materials: ionic polarization and dipole rotation. The major heating mechanism in microwave heating is dipole rotation, in which polar molecules (water being the most common polar material in foods) are rotated by the alternating microwave field resulting in frictional heat generation. Ionic conductivity is more important during radio frequency heating and occurs when ions in solution move in response to an electric field; the ions are accelerated and collide with each other converting kinetic energy into heat.

This report studies the global Industrial Dielectric Heating Equipment production, demand, key manufacturers, and key regions.
