Abstracts

The global Industrial Displacement Sensor market size is expected to reach \$ 3947.8 million by 2029, rising at a market growth of 5.1% CAGR during the forecast period (2023-2029).

Global 5 largest manufacturers of industrial displacement sensor are KEYENCE,

IFM Electronic, Turck, OMRON Corporation and Balluff, which make up nearly 34% of the market share. Among them, KEYENCE dominate with 18% production value share, followed by IFM (5%) and Truck (4%). Key players base in Europe, North America, Japan, Southeast Asia and China.

Asia-Pacific is the largest market, holding a share about 40%, followed by North America, and Europe, with share 27% and 23%, separately.

There are two types of industrial displacement sensors, including contact type sensor and non-contact type sensor. The non-contact type sensor dominants with a market share of three quarters. In terms of application, industrial displacement sensors are mainly used in automotive industry, aerospace & military industry, industrial manufacturing and electronics industry. The largest application area is automotive industry, holding a share of 37% around.

Displacement is a quantity related to the orientation change of an object during motion, and the measurement method of displacement covers a wide range of scales.

Displacement sensors are often used in industrial production. Displacement sensors, also known as linear sensors, are linear devices that belong to metal induction. The

function of displacement sensors is to convert various measured physical quantities into electrical energy, and output different electrical energy according to the size of the displacement. The magnitude of the displacement of the signal, and then the magnitude of the displacement can be determined.

The displacement sensor is mainly used to measure distance. The difference between it and the proximity sensor is that the displacement sensor is a precision measurement with an accuracy range between nm and mm, and is used for precision measurement in industry or laboratories. The proximity sensor is an inaccurate indicator, and can only measure two indicators, whether it is close or far away, and is used for primary detection in industry. The statistical scope of this article does not include proximity sensors.
