Abstracts

The global Industrial Grade Dextrins market size is expected to reach \$ 161.5 million by 2029, rising at a market growth of 5.5% CAGR during the forecast period (2023-2029).

Yellow dextrin's solubility in cold water is more than 99%, and the viscosity is low, which is close to the Newtonian viscosity. It is stable at the concentration of 70%, also has the fluidity, shows a strong viscosity and has the basic properties of binding cellulose raw materials and forming water-soluble film and bonding inorganic materials.

White dextrin is almost white, whose solubility is nearly 90% in cold water, the solution shows non-newtonian viscosity, easy to aging. Usually used to fiber shaping, paper surface sizing and adhesives, water-soluble coatings, various adhesives, etc.

Dextrins for Industrial Use include white dextrin and yellow dextrin.

White Dextrin is used in the Textile with Starch during sizing of yarn or cloth provides increased adhesiveness, reducing cost of sizing and gives a superior feel to the cloth. White dextrins do not react to chemicals and are suitable for their applications in textile industry. White dextrin is soluble in cold water.

Yellow dextrin has low viscosity and is very sticky and hygroscopic in nature. Used in the foundry as a binder for cores. Yellow dextrin helps in increasing dry strength at the same time being completely soluble in water. It is also used in water soluble glues, as a printing thickener and as a binder in paint. Yellow Dextrin are prepared by heat treatment in presence of chemicals to suitably modify characteristics and properties of starch.
