## Abstracts

The global Industrial Grade Paraformaldehyde market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

Paraformaldehyde is a white crystalline solid polymer with pungent odor and generates toxic formaldehyde gas when heated. It may react violently with strong oxidizing agents and less with bases. Paraformaldehyde is slightly soluble in alcohols and insoluble in ethers, hydrocarbons, and carbon tetrachloride. Paraformaldehyde after depolymerization results in the formation of formaldehyde in solution which can be used as a fumigant, disinfectant, fungicide, fixative. Paraformaldehyde reacts with either phenol, urea, melamine or resorcinol to produce resin. It is also used in the production of inks of a wide array of ink applications like dollar bills, books, and other printing materials.

This report studies the global Industrial Grade Paraformaldehyde production, demand, key manufacturers, and key regions.
