Abstracts

The global Industrial Grade Spodumene market size is expected to reach \$ 5783 million by 2032, rising at a market growth of 5.6% CAGR during the forecast period (2026-2032).

Industrial-grade spodumene is a lithium-containing mineral raw material primarily used for lithium resource extraction and various industrial processing applications. This mineral mainly originates from hard rock pegmatite deposits and its main component is lithium-containing aluminum silicate. Compared to battery-grade spodumene concentrate, industrial-grade spodumene is more widely used in ceramics, glass manufacturing, metallurgy, and some chemical industries, where lithium purity requirements are relatively lower. This material can improve the heat resistance, mechanical strength, and chemical stability of ceramic and glass products. Furthermore, industrial-grade spodumene serves as a basic raw material for the production of lithium chemicals such as lithium carbonate and lithium hydroxide, playing a crucial role in multiple industrial production processes. The upstream of the industrial-grade spodumene industry chain mainly includes mineral exploration, ore mining, crushing, and beneficiation. The midstream mainly involves ore concentration, roasting, and chemical conversion to produce lithium mineral products or lithium chemicals suitable for industrial applications. Downstream applications mainly include ceramics manufacturing, glass production, metallurgical fluxing materials, specialty chemicals, and lithium chemical production industries. In addition, bulk mineral logistics, port transportation, and mineral trading companies also play an important role in the global supply chain. Global industrial-grade spodumene production is projected to reach approximately 5.36 million tons in 2025, with an average global market price of around US\$720 per ton. Major companies in the industry are expected to have gross profit margins ranging from 25% to 45%. Global industrial-grade spodumene production

capacity is projected to reach approximately 7.15 million tons in 2025.

The Industrial Grade Spodumene market is influenced by the broader development of the lithium industry and industrial mineral demand. While battery-grade lithium materials have attracted significant attention due to electric vehicle growth, industrial grade spodumene continues to play a stable role in ceramics, glass, and metallurgical industries. Demand for high-performance ceramic materials and specialty glass products is supporting the consumption of spodumene in traditional industrial sectors. In addition, fluctuations in lithium chemical markets can indirectly influence industrial spodumene supply and pricing. Expansion of hard-rock lithium mining projects and improvements in mineral processing technologies are expected to increase global supply capacity. The market is likely to maintain moderate growth as both industrial mineral applications and lithium chemical processing demand continue to develop.
