Abstracts

According to our (Global Info Research) latest study, the global Industrial Interlock Switches market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Interlock Switches are Switches that prevents gear shift lever from moving from park position until brake is applied. It is a switch designed for mounting on a door, drawer, or cover so that it opens automatically when the door or other part is opened. A safety interlock switch is a normally open valve that closes in the event of a process upset. Usually it is attached to electronics that perform logic operations on process conditions. Safety interlock switches are designed to work together with hinged, sliding, or lift-off guards and barriers.

The interlock safety switches are designed to provide position interlock detection for moving guards. The actuator is fitted to the moving part (frame) of the guard and is aligned to the switch entry aperture. The interlocking switches have rotary heads which provides ease of mounting and offer different actuator entry positions. Some of the switches can be locked in the protective position which prevents unwanted access to machinery until dangerous operations have ceased. All switches are robust and can withstand severe environments. Depending on the environment where the switch will be used, different material can be chosen.
