In 2025, the global production capacity of Industrial Membrane Degassing System was approximately 11,000 units.

Industrial Membrane Degassing System is a specialized separation and purification equipment used to remove dissolved gases from liquids through membrane-based mass transfer technology. The system utilizes gas-permeable membranes and vacuum or sweeping gas methods to efficiently reduce oxygen, carbon dioxide, and other dissolved gases without chemical additives. It is mainly used in water treatment, semiconductor manufacturing, pharmaceutical production, food and beverage processing, chemical industries, and high-purity fluid applications. The product boundary includes complete membrane degassing systems and integrated modules, excluding standalone membrane materials and general filtration equipment.

The industrial membrane degassing system industry chain includes upstream suppliers of membrane materials, housings, pumps, valves, sensors, and control components; the midstream sector covers membrane module manufacturing, system integration,

assembly, testing, and process optimization; the downstream sector includes semiconductor plants, pharmaceutical facilities, water treatment systems, food processing plants, and chemical production. Market growth is driven by increasing demand for high-purity liquids, advanced manufacturing processes, and efficient gas removal technologies.

This report studies the global Industrial Membrane Degassing System production, demand, key manufacturers, and key regions.
