According to our (Global Info Research) latest study, the global Industrial Plastic Processing Machinery market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Plastics are mainly organic polymers of high molecular mass, but they sometimes contain other substances as well. Plastics are usually synthetic, most commonly derived from petrochemicals, but many are partially natural. Plastics are usually classified by their chemical structure of the polymer's backbone and side chains. Some important groups in these classifications are the acrylics, polyesters, silicones, polyurethanes, and halogenated plastics. There are a variety of methods used to process plastic. Each method has its advantages and disadvantages and are better suited for specific applications.

Plastic processing can be defined as the process of converting the plastics raw material into semi-finished products. Examples are Buckets, Automobile Parts, Crates, Tanks, Pipes, Bottles, Carry bags, Ropes, Profiles etc. Classification of processing methods are : 1. Primary Processing Methods: Injection, Extrusion, Blow, Compression and transfer moulding. 2. Secondary Processing Methods: Roto, Thermoforming, Coating, Casting, Fabrication and Calendaring etc. 3. Tertiary Processing Methods: Cutting, Drilling, Welding and Bending etc.
