An industrial robot end effector, also known as an end-of-arm tooling (EOAT), is a device or tool that is attached to the end of a robot arm to perform a specific task or function. The end effector is the part of the robotic system that interacts directly with the workpiece or object being manipulated. There are many different types of end effectors that can be used for various applications, such as grippers, vacuum cups, welding torches, and cutting tools. The choice of end effector depends on the task that needs to be performed and the characteristics of the object being manipulated. The design of the end effector can have a significant impact on the efficiency, accuracy and quality of the robotic system.
