Abstracts

According to our (Global Info Research) latest study, the global Industrial Silicon Smelting Furnace market size was valued at US\$ 211 million in 2025 and is forecast to a readjusted size of US\$ 313 million by 2032 with a CAGR of 5.5% during review period.

Industrial silicon smelting furnaces are core thermal equipment in the industrial production of crystalline silicon or industrial silicon. As a typical submerged arc furnace, it generates an electric arc between the electrodes and the furnace charge, combined with the resistance heat generated when current flows through the charge, creating a high-temperature zone exceeding 2000°C. This zone allows for the carbothermic reduction reaction of silicon dioxide (SiO₂) in silica with carbonaceous reducing agents (such as charcoal or petroleum coke), thereby refining molten metallic silicon.

Structurally, silicon smelting furnaces mainly consist of a power supply system (including the submerged arc furnace transformer and short grid), an electrode system, a water cooling system, and the furnace body. Based on the furnace body structure, they can be mainly divided into two categories: open-type and closed-type. Meanwhile, rotary furnace technology is being increasingly widely used, helping to improve furnace temperature distribution and increase smelting efficiency. With a gross profit margin of approximately 30%.
