## Abstracts

A transformer is a static electrical device that transfers electrical energy between two or more circuits through electromagnetic induction. A varying current in one coil of the transformer produces a varying magnetic field, which in turn induces a varying electromotive force(emf) or "voltage" in a second coil. Power can be transferred between the two coils, without a metallic connection between the two circuits.

Scope of the Report:

This report focuses on the Industrial Transformer in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa.
