The global Industrial Visual Inspection System market size is expected to reach \$ 25920 million by 2029, rising at a market growth of 10.7% CAGR during the forecast period (2023-2029).

Industrial vision inspection systems help monitor work environments. It provides functions such as process control, robot guidance and automatic inspection in industrial applications. The increasing complexity of industrial production and manufacturing activities makes it difficult and increasingly unreliable for people to keenly detect, observe and inspect production activities. The technology is widely adopted in industrial operations and is significantly replacing manual inspection and measurement due to the increasing demand for efficient and reliable inspection and measurement. Vision inspection systems deploy smart cameras and image processing to perform measurements and inspections. The growing demand for advanced inspection and increasing automation are key influencing factors paving the way for significant adoption of machine vision technology. Additionally, the need for enhanced quality control from consumers and manufacturers, coupled with government regulations to comply with mandated specifications, is expected to drive the adoption of visual inspection technology. The technology is gaining considerable traction in food and packaging, automotive, pharmaceuticals, and other industrial verticals due to capabilities such as improved object detection, enhanced analytics, monitoring tolerances, and precise ingredient measurement, all of which are expected to grow in the forecast Drive market growth during the period.

Industrial visual inspection systems are used to automate manufacturing processes and production lines and are valuable for automating inspection and quality control processes. The use of these systems results in higher production yields, lower defect

rates, and the delivery of a consistently high-quality product, which is important for customer satisfaction and brand reputation. Beyond industrial manufacturing applications, IoT machine vision technology is being used in medical and dental applications to improve patient care. Medical robots equipped with imaging technology assist surgeons during procedures, IoT machine vision system is also helping to diagnose skin diseases, perform rapid and accurate complete blood counts, and identify tumors from optical analysis of x-rays and other medical imaging sources.
