## **Abstracts**

According to our (Global Info Research) latest study, the global Inert Gas Nebulizer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

An inert gas nebulizer is a device that is used to generate a fine mist or aerosol of liquid by using a stream of inert gas, such as nitrogen or argon. The liquid is typically a solution or suspension of a drug, which can be inhaled by the patient to achieve therapeutic effects.

The nebulizer works by using a high-pressure gas to create a low-pressure area that draws the liquid into the nebulizer. The gas and liquid then mix and exit the device as a fine mist or aerosol, which can be inhaled by the patient through a mouthpiece or mask.

Inert gas nebulizers are commonly used in the treatment of respiratory diseases, such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis. They are also used to deliver medication to patients who have difficulty using other forms of inhalation therapy, such as metered-dose inhalers or dry powder inhalers.
