Abstracts

According to our (Global Info Research) latest study, the global Infant Safety Carrier market size was valued at US\$ 1055 million in 2024 and is forecast to a readjusted size of USD 1250 million by 2031 with a CAGR of 2.4% during review period.

Infant safety carriers are child safety seats designed for newborns. The main difference between infant safety carriers and other child safety seats is that infant safety carriers can only be installed in reverse, while other child safety seats are generally installed in forward direction. However, there are also products such as Qiaoeryi Safety Guardian that can be installed in both directions. In addition, infant safety carriers are generally semi-lying designs, while other safety seats rarely have such designs. The semi-lying design combined with the reverse installation can better protect the baby's safety, because when the baby is riding in reverse and encounters a collision, the reclining baby's back will be subjected to a larger force area, which can greatly reduce the pressure on other parts of the body and reduce the damage.
