Abstracts

Influenza is an infectious disease and affects the upper respiratory tract in humans. The disease is common in children and elderly population (aged 65 years and above). The disease has a huge impact on Public Company health. Influenza A virus poses a greater risk as compared to the influenza B virus. The B virus is responsible for 20% to 25% of infections globally. Proper collection, storage and transport of respiratory specimens are the essential first step for laboratory detection of influenza virus infections. Laboratory confirmation of influenza virus from throat, nasal and nasopharyngeal secretions or tracheal aspirate or washings is commonly performed using direct antigen detection, virus isolation, or detection of influenza-specific RNA by reverse transcriptase-polymerase chain reaction (RT-PCR).
