## Abstracts

The global Infrared Distance Sensors market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Infrared ranging sensor is a sensing device, which is a measuring system using infrared rays as the medium. It has a wide measuring range and short response time. It is mainly used in modern technology, national defense and industrial and agricultural fields. The infrared ranging sensor has a pair of infrared signal emitting and receiving diodes. The infrared ranging sensor used emits a beam of infrared light, which forms a reflection process after being irradiated to the object, and receives the signal after reflecting to the sensor, and then uses the CCD image processing Receive the data of the time difference between transmission and reception. After being processed by the signal processor, the distance of the object is calculated. This can be used not only on natural surfaces, but also with reflective panels. Long measurement distance, high frequency response, suitable for harsh industrial environments.
