Infrared heating plate is a device that uses infrared radiation to heat objects or surfaces. It is usually made of a flat plate containing a series of infrared heating elements, which emit radiation in the form of heat waves. Infrared heating plates are commonly used for industrial and commercial applications, such as drying, curing, and heating processes. They are also used in residential environments as energy-saving alternatives to traditional heating systems. The working principle of an infrared heating plate is to emit radiation absorbed by objects and surfaces in the surrounding area, and then release the heat back into the environment. This process is called radiation heating and is more effective than traditional convective heating, which relies on heating the air around the object to transfer heat. Infrared heating plates come in various sizes and configurations, including portable heating plates that can be easily moved from one position to another. They can also provide different rated power and temperature control, allowing for precise temperature regulation in various applications.
