Abstracts

The technique of capturing and converting invisible infrared images into visible images is called infrared imaging. Visible light is easily detected by the human eye, but to see infrared light it is important to have infrared cameras and imagers. These devices possess special sensors that operate without the need of visible light. The radiations in the infrared imaging technique are emitted by the targeted objects or are reflected radiations. The imaging devices have infrared illuminator lasers with LEDs (Light Emitting Diodes) for the purpose of illumination. The infrared radiations emitted by warm objects are detected by thermal infrared imagers directing them to infrared sensor array. These sensor arrays convert infrared signals into electric signals which are then converted into an image.

SCOPE OF THE REPORT:

This report studies the Infrared Imaging market status and outlook of Global and major regions, from angles of players, countries, product types and end industries; this report analyzes the top players in global market, and splits the Infrared Imaging market by product type and applications/end industries.

North America held the largest share of the market in 2017, and the market in this region is expected to witness significant growth during the forecast period. The high adoption of infrared imaging cameras in the US has led to the dominant position of North America in the infrared imaging market.
