Abstracts

According to our (Global Info Research) latest study, the global Infrared Inoculation Loop Sterilizer market size was valued at US\$ 363 million in 2024 and is forecast to a readjusted size of USD 480 million by 2031 with a CAGR of 4.0% during review period.

The infrared inoculation loop sterilizer works based on the principle of electronic infrared. It uses the thermal and chemical effects of infrared rays to denature the proteins of bacteria, viruses and other microorganisms through radiation, thereby destroying their structure and function to achieve the purpose of sterilization. Specifically, the items to be sterilized are placed in a high-efficiency ceramic infrared heating tube with a temperature of hundreds of degrees Celsius (different models have different temperatures, such as 800?, 825? $\pm$ 25?, nearly 900?, etc.), and are burned at high temperature for several seconds (such as 34 seconds, 57 seconds) to achieve the sterilization effect. The infrared inoculation loop sterilizer is mainly used for high-temperature sterilization and disinfection of small items such as inoculation loops and inoculation needles. It can completely replace traditional alcohol lamps and provide a more convenient and quick disinfection method. It is widely used in biological safety cabinets, clean workbenches, exhaust fans, mobile vehicles and other environments. It can even be used conveniently in harsh environments such as the wild, and high-temperature sterilization and disinfection can be performed at any time.
