Infrared IP Camera is a new generation of camera produced by combining traditional cameras and network technology. It can transmit images to the other side of the earth through the network, and the remote viewer does not need any professional software, as long as a standard web browser You can monitor its image. Infrared IP Camera has a built-in embedded chip and uses an embedded real-time operating system. The video signal sent by the camera is digitized and then compressed by an efficient compression chip, and then transmitted to the Web server through the network bus. Users on the network can directly view the camera images on the Web server with a browser, and authorized users can also control the movement of the camera pan/tilt lens or operate the system configuration.
