## Abstracts

According to our (Global Info Research) latest study, the global Infrared (IR) Cameras market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Infrared (IR) Cameras are imaging devices, which forms images based on thermal or infrared radiation, similar to common camera, which forms images using visible light and then converts into electronic signal, which is then processed to produce a thermal image and perform temperature calculations. Infrared cameras generate monochrome images because the image sensors used in Infrared cameras does not distinguish different wavelengths of infrared radiation. Infrared cameras not only monitor thermal performance but also identify and evaluate severity of heat related problems.

Development of high-speed infrared cameras with suitable sensors for measuring temperature and evaluating the relative severity of heat is a driver that contributes to the growth of infrared imaging market.
