## Abstracts

The global Infrared Long Pass Filter market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An infrared long-wavepass filter is an optical element that can transmit infrared light greater than a certain wavelength and cut off light smaller than that wavelength. They are often used to isolate broad regions of the spectrum, or for applications such as infrared spectroscopy and thermal imaging. Infrared long-wavepass filters can be made with different substrates and film materials. Common substrates include silicon and germanium, which have different transmittances and absorption characteristics in different wavelength bands. Membrane materials are generally dielectric materials that can form a hard and durable outer surface coating. The design and preparation of long-wavelength infrared filters requires consideration of optical constants, dispersion relationships, absorption characteristics and other factors of the substrate and film material.

This report studies the global Infrared Long Pass Filter production, demand, key manufacturers, and key regions.
