According to our (Global Info Research) latest study, the global Infrared Narrow Band Filter market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An infrared narrowband filter is an optical device used to selectively transmit or reflect infrared light in a specific wavelength range. It can achieve high transmittance or high reflectivity in the infrared spectrum and only allows a very narrow range of wavelengths to pass through. This filter is usually made of special optical materials, such as silicon, silicon silicide, zinc silicide, zinc selenide, etc. The working principle of infrared narrowband filters is based on the interference and absorption characteristics of light. They utilize multilayer thin film deposition technology to deposit a series of thin film layers on an optical substrate, each with a specific refractive index and thickness. By adjusting the refractive index and thickness of the thin film layer, selective transmission or reflection of infrared light in a specific wavelength range can be achieved. Infrared narrowband filters play a key role in many applications, such as infrared spectrum analysis, infrared imaging, lasers, optical communications and other fields. They can help filter out unwanted light and improve the signal-to-noise ratio and performance of optical systems. According to specific application requirements, infrared narrowband filters can have different design parameters, such as central wavelength, bandwidth, transmittance and reflectivity, etc.
