## Abstracts

The global Infrared Thermopile Gas Sensor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Infrared thermopile gas sensor is a sensor that uses the absorption characteristics of infrared light to detect gas concentration. Its working principle is: when the infrared light source emits infrared light, after passing through the gas sample, part of the infrared light is absorbed by the gas molecules, and the remaining infrared light is received by the thermopile detector. The thermopile detector is composed of multiple thermocouples connected in series. When the energy of the incident infrared light changes, a proportional thermoelectric potential will be generated at both ends of the thermopile. By measuring this thermoelectric potential, the concentration of the gas can be inferred.

This report studies the global Infrared Thermopile Gas Sensor production, demand, key manufacturers, and key regions.
