An infusion device is a medical system designed to deliver liquid medications, nutrients, or irrigation fluids into the human body or a target system at a controlled flow rate. It operates through gravity-based mechanisms or electrically driven pumps to achieve continuous or intermittent infusion. The system typically consists of infusion tubing, flow control mechanisms, drive modules, and monitoring alarm units. Its core function is to ensure dosing accuracy and patient safety, and it is widely used in clinical treatment and care settings.

Upstream includes medical-grade polymer materials such as PVC and silicone, micro motors and drive modules, flow sensors, and control circuits. Downstream applications include hospital wards, intensive care units, and home care environments. The overall industry gross margin generally ranges from 35% to 55%, with higher margins for intelligent and precision-controlled systems.

The global production of infusion devices is projected to reach 1.2 million units by 2025, with an average price of \$2,130 per unit.
