Abstracts

According to our (Global Info Research) latest study, the global Inhalation Exposure System market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes. An inhalation exposure system is a laboratory device used in the study of inhalation drug delivery or inhalation toxicity. The respiratory system is the main way for oxygen to enter the human body, and drugs or toxic substances can also enter the human body through the respiratory system. The inhalation exposure system is to allow experimental animals to inhale drugs or toxic substances in a controlled manner under laboratory conditions to conduct research on drug safety and effectiveness or toxicological effects. The inhalation exposure system usually consists of several parts such as generator, monitoring and control part, exposure chamber, and exhaust gas treatment. The experimental drug is in the form of dust, or in the form of solution after being dissolved in liquid, and generates dust aerosol or liquid aerosol in the generator, or volatilizes into gas and enters the exposure chamber. During the experiment, the control of the drug dose, the control of the airflow balance in the exposure chamber, the control of the experiment time, and the monitoring of the experimental environment parameters (oxygen, carbon dioxide concentration, temperature and humidity, pressure in the exposure chamber, etc.) require an automated system to be done. This automated system is the monitoring and control part of the inhalation exposure system. This report is a detailed and comprehensive analysis for global Inhalation Exposure System market. Both quantitative and qualitative analyses are presented by manufacturers, by region & country, by Type and by Application.
