## Abstracts

According to our (Global Info Research) latest study, the global Inhalational Anaesthetic Agents market size was valued at US\$ 1086 million in 2025 and is forecast to a readjusted size of US\$ 1407 million by 2032 with a CAGR of 3.8% during review period.

Inhalational anaesthetic agents are volatile liquids or gases that are breathed in through the lungs to produce and maintain general anaesthesia, causing a controlled, reversible state of unconsciousness along with reduced pain perception, amnesia, and suppression of movement and reflexes during surgery or procedures. They are delivered via an anaesthesia machine and vaporizer (for volatile liquids) or as a medical gas, mixed with oxygen or air and titrated in real time by adjusting the inspired concentration; their clinical effect depends largely on how they move from the lungs into the bloodstream and then the brain, which is influenced by factors like blood-gas solubility (speed of onset and recovery), ventilation, and cardiac output. Common examples include sevoflurane, isoflurane, desflurane, and nitrous oxide, chosen based on desired speed, haemodynamic stability, airway tolerance, and patient factors; while generally safe under monitoring, they can cause side effects such as low blood pressure, respiratory depression, postoperative nausea and vomiting, and—rarely—malignant hyperthermia in susceptible individuals. The product has an average price of \$200-350 per kilogram and a production volume of approximately 4,000 tons per year.

Upstream for inhalational anaesthetic agents begins with basic petrochemical feedstocks that are converted into highly fluorinated/halogenated intermediates using specialty reagents (notably fluorinating and chlorinating agents), catalysts, and tightly controlled reaction and purification steps, because these products must meet very high

purity and stability requirements under pharmaceutical GMP; manufacturers then distill and dry the anesthetic to specification, perform rigorous QC (impurities, water content, identity), and fill it into dedicated, moisture-tight bottles/canisters with compliant labeling and cold-chain-free but controlled logistics. Downstream, finished product moves through pharma wholesalers and hospital procurement channels to operating rooms and ambulatory surgery centers, where it is used with anesthesia machines and calibrated vaporizers (plus carrier gases) and supported by consumables and infrastructure such as breathing circuits, CO<sub>2</sub> absorbents, and waste-gas scavenging systems; used anesthetic largely leaves the patient via exhalation and is routed into scavenging/disposal pathways (increasingly with capture/destruction or monitoring in some facilities), while ongoing demand is driven by surgical volumes, formulary choices, and workplace exposure and environmental management practices.
