## Abstracts

The global Injectable Peptides market size is expected to reach \$ 43880 million by 2029, rising at a market growth of 4.1% CAGR during the forecast period (2023-2029).

Injectable peptide drugs offer several advantages over other administration routes, such as oral or topical delivery. When injected, peptides can bypass the gastrointestinal tract, avoiding issues such as degradation by stomach acid or poor absorption. Additionally, injections can provide a more rapid and direct delivery of the drug into the bloodstream, allowing for faster onset of action.

Peptide-based injectable drugs refer to medications that contain peptides as their active ingredients and are administered via injection. Peptides are short chains of amino acids, which are the building blocks of proteins. They play crucial roles in various biological processes and can be used therapeutically to target specific cellular pathways or receptors.
