According to our (Global Info Research) latest study, the global Injection Molding Ferrite market size was valued at US\$ 550 million in 2024 and is forecast to a readjusted size of USD 748 million by 2031 with a CAGR of 4.5% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Injection molded ferrite is a type of bonded magnet produced through injection molding process, which involves mixing, refining, and extruding permanent ferrite powder with thermoplastic binders such as PA12/Nylon 12, PA6/Nylon 6, or polyphenylene sulfide (PPS), as well as a small amount of polymer additives (including coupling agents, lubricants, antioxidants, and plasticizers). The injection molded ferrite based on nylon 12, nylon 6, and polyphenylene sulfide can reach maximum working temperatures of 120 °C, 150 °C, and 180 °C, respectively. Injection molded ferrite materials have high utilization rate, good toughness, are suitable for complex shapes, high dimensional accuracy, do not require subsequent processing, and are suitable for large-scale mass production. They can also be combined with components made of other materials during the injection molding process to form components.
