## Abstracts

The global Innovation Management System market size is expected to reach \$ 2161 million by 2032, rising at a market growth of 12.1% CAGR during the forecast period (2026-2032).

An Innovation Management System (IMS) is a type of digital platform for enterprises, designed to systematically manage the entire process of ideas, concepts, and innovation opportunities, from collection and screening to execution and implementation. Its main functions include idea solicitation, review and prioritization, innovation project initiation, resource allocation, project management, and value measurement and review of innovation outcomes. This type of software helps organizations transform fragmented creative activities into actionable innovation pipelines, supports cross-departmental collaboration, and improves the efficiency and transparency of innovation project execution. IMS typically integrates idea pools, review workflows, innovation portfolio management tools, stage gate management, and risk control mechanisms to ensure the visibility and compliance of the innovation process. Furthermore, this type of software often combines data analytics and artificial intelligence to help enterprises sift through massive amounts of ideas to identify promising projects and continuously optimize the innovation process through real-time data tracking and feedback mechanisms. Compared to traditional idea management tools, IMS emphasizes strategic management of innovation and end-to-end execution tracking. The gross profit margin for Innovation Management Systems is projected to be approximately 54%-68% by 2025.

Innovation Management Systems are evolving from standalone idea-gathering tools into core platforms encompassing innovation governance. Against the backdrop of macroeconomic uncertainty and growth pressures, companies are increasingly shifting innovation from fragmented activities to quantifiable portfolio management: on the one hand, this allows them to justify innovation investment even when budgets tighten; on

the other hand, it enables rapid adjustments to project priorities and resource allocation during strategic shifts. Simultaneously, the digitalization of R&D and products, along with the widespread adoption of collaborative office tools, has lowered the barriers to cross-departmental collaboration, driving the online and standardized transformation of innovation processes. This trend is even more pronounced in industries with higher compliance and traceability requirements, such as manufacturing, pharmaceuticals, finance, and the public sector. The main drivers of future growth will come from three types of changes: First, increased governance demands, requiring companies to unify and consolidate ideas, needs, technological trends, and external ecosystem clues, forming an auditable decision-making chain; second, the penetration of data and AI capabilities, with platforms beginning to create reusable models and templates for review prioritization, portfolio optimization, risk warning, and value tracking, thereby shortening the cycle from idea to project initiation; and third, deeper integration with existing systems, with innovation platforms connecting with project management, R&D processes, collaboration suites, and data platforms, making innovation operations more like an end-to-end production line rather than a series of workshops and spreadsheet compilations. At the same time, the market also faces challenges in implementation and value proof: the difficulty of innovation management often lies not in feature stacking, but in the reconstruction of organizational mechanisms and indicator systems. Without high-level guidance, clear review standards, and resource pool rules, platforms can easily become mere idea repositories. On the vendor side, it is necessary to balance the cost structure of product standardization and industry-differentiated delivery, avoiding diluting software gross margins due to excessive customization and consulting. Downstream demand will lean more towards rapidly deployable SaaS solutions and configurable workflows, with clearer requirements regarding security, data residency, and access control.
