According to our (Global Info Research) latest study, the global Inorganic Scintillating Materials market size was valued at US\$ 294 million in 2024 and is forecast to a readjusted size of USD 528 million by 2031 with a CAGR of 8.7% during review period.

Inorganic scintillating materials are a class of compounds that emit light (scintillation) when exposed to ionizing radiation, such as X-rays, gamma rays, or charged particles. These materials, typically crystals or ceramics, are widely used in applications like medical imaging (e.g., CT scanners), high-energy physics, radiation detection, and security screening. Inorganic scintillators, such as sodium iodide (NaI), cesium iodide (CsI), and bismuth germanate (BGO), are valued for their high density, effective atomic number, and light yield, which contribute to their ability to detect radiation efficiently and with good spatial resolution. Their performance is influenced by properties such as energy resolution, decay time, and radiation hardness.
