Inorganic soil remediators refer to products made from a series of inorganic materials as the main ingredients through a specific process, which are used to repair and improve the performance of polluted or degraded soil. These inorganic materials usually include naturally occurring minerals or industrial wastes such as lime, calcium carbonate, steel slag, and zeolite. They have unique physical and chemical properties and can provide solutions for different types of soil pollution problems. Some inorganic soil remediators such as lime and calcium carbonate can adjust the pH value of the soil to make the soil environment more suitable for plant growth, while reducing the bioavailability of pollutants such as heavy metals and reducing their migration into the plant body.
