According to our (Global Info Research) latest study, the global InSAR Technology market size was valued at USD 240.8 million in 2022 and is forecast to a readjusted size of USD 652.7 million by 2029 with a CAGR of 15.3% during review period.

Interferometric synthetic aperture radar, abbreviated InSAR, is a radar technique used in geodesy and remote sensing. This geodetic method uses two or more synthetic aperture radar (SAR) images to generate maps of surface deformation or digital elevation, using differences in the phase of the waves returning to the satellite or aircraft. The technique can potentially measure millimetre-scale changes in deformation over spans of days to years. It has applications for geophysical monitoring of natural hazards, for example earthquakes, volcanoes and landslides, and in structural engineering, in particular monitoring of subsidence and structural stability.

The global InSAR market is projected to grow from US\$ 298.6 million in 2023 to US\$ 725.9 million by 2029, at a Compound Annual Growth Rate (CAGR) of 16.0% during the forecast period.

The US & Canada market for InSAR is estimated to increase from \$ 115.0 million in 2023 to reach \$ 267.1 million by 2029, at a CAGR of 15.1% during the forecast period of 2023 through 2029.

The China market for InSAR is estimated to increase from \$ 31.6 million in 2023 to reach \$ 84.6 million by 2029, at a CAGR of 17.8% during the forecast period of 2024 through 2029.
