Abstracts

The global Insect Drying market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The insect dryer dries sequentially from the outside to the inside. During the preheating period, the surface of the insect can be dried at low temperature first, and then the temperature gradually increases. The gradual drying from the outside to the inside is almost simultaneous drying. The surface is dried first and then It can form a barrier to lock the moisture and nutrients inside the insect from being completely evaporated, and the surface is crispy and the inside is juicy.
