Abstracts

According to our (Global Info Research) latest study, the global Insect Genomic DNA Extraction Kit market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

This kit uses a unique lysate that can effectively remove polysaccharides, polyphenols, etc. It can extract DNA from insects, mollusks, arthropods, roundworms and other samples. Samples stored in alcohols are also suitable for the extraction of this kit. One operation can process tissues less than 50Chemicalbookmg. The sample is digested by the lysate, and most of the polysaccharides and polyphenols are separated and removed by chloroform. After further purification by the separation column, high-purity DNA can be obtained. The obtained DNA can be used in PCR, Southern hybridization, enzyme digestion and other experiments.

The Insect Genome DNA Extraction Kit is specially designed for extracting genomic DNA from lower non chordate animals such as insects, including some plant tissues. This method combines the CTAB splitting method Chemicalbook and silica gel column purification method, which can effectively remove various pigments, chitin, polysaccharides and other impurities. The purified DNA can be directly used in PCR, Southern hybridization, enzyme digestion and other subsequent experiments
