Abstracts

An insect growth regulator (IGR) is a substance (chemical) that inhibits the life cycle of an insect. IGRs are typically used as insecticides to control populations of harmful insect pests such as cockroaches and fleas.

Scope of the Report:

This report focuses on the Insect Growth Regulators in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. On the basis of type, the market was led by chitin synthesis inhibitors followed by juvenile hormone analogs & mimics in 2017. The chitin synthesis inhibitor compound restricts the growth of chitin which is responsible for growth of the exoskeleton among targeted insects. Chitin synthesis inhibitors are widely used, as they are able to control fleas that live on pets and cattle. These are also used to control fungal species apart from insects. Their wide application has led chitin synthesis inhibitors to be the market leader by type.

The agricultural segment had the largest market share in 2017. The use of insect growth regulators on field crops is widespread, and at present many chitin synthesis inhibitors have the ability to control pests in agricultural crops such as tomato, pigeon pea, sorghum, and other crops of high value. In many countries, insects such as locusts and grasshoppers are considered to be major pests causing significant damage in many field crops.

The worldwide market for Insect Growth Regulators is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
