Abstracts

Insect pest control is the regulation or management of a species defined as a pest, a member of the animal kingdom that impacts adversely on human activities. The human response depends on the importance of the damage done, and will range from tolerance, through deterrence and management, to attempts to completely eradicate the pest. Pest control measures may be performed as part of an integrated pest management strategy

Scope of the Report:

This report focuses on the Insect Pest Control in global market, especially in North America, Europe and Asia-Pacific, South America, Middle East and Africa. This report categorizes the market based on manufacturers, regions, type and application. The chemical control method was largely used for insect pest control in 2017 due to the significant demand for pyrethroids for its limited application rate and compatibility against a variety of insects. Termite control, on the basis of insect type, accounted for the largest share in 2017 owing to its higher demand in industrial and residential sectors for pre- & post-construction treatment and wooden house treatment, respectively. North America accounted for the largest share in 2017 due to its significant growing demand in both commercial and residential applications. The Asia Pacific is projected to be the fastest-growing region from 2018 to 2023 due to the stringent need for commercial establishments and industrial sectors (such as food processing, food service industries, and tourism sectors) to comply with pest control regulations within their premises. The worldwide market for Insect Pest Control is expected to grow at a CAGR of roughly xx% over the next five years, will reach xx million US\$ in 2023, from xx million US\$ in 2017, according to a new GIR (Global Info Research) study.
