According to our (Global Info Research) latest study, the global Insect Pest Control market size was valued at USD 4327.8 million in 2023 and is forecast to a readjusted size of USD 5888.7 million by 2030 with a CAGR of 4.5% during review period.

Insect pest control is the regulation or management of a species defined as a pest, a member of the animal kingdom that impacts adversely on human activities. The human response depends on the importance of the damage done, and will range from tolerance, through deterrence and management, to attempts to completely eradicate the pest. Pest control measures may be performed as part of an integrated pest management strategy

The chemical control method was largely used for insect pest control in 2017 due to the significant demand for pyrethroids for its limited application rate and compatibility against a variety of insects. Termite control, on the basis of insect type, accounted for the largest share in 2017 owing to its higher demand in industrial and residential sectors for pre- & post-construction treatment and wooden house treatment, respectively.
