Abstracts

According to our (Global Info Research) latest study, the global Insulating Hot Press Film market size was valued at US\$ 3210 million in 2025 and is forecast to a readjusted size of US\$ 5444 million by 2032 with a CAGR of 7.8% during review period.

In 2025, the global output of insulating hot press film is estimated to be approximately 480,000 tons, with an average selling price of about 6,500 US dollars per ton and a gross profit margin of approximately 45%. The single-line production capacity is estimated to be about 5,000 tons per year. Insulating hot press film is a composite film formed by pressing multiple layers of materials together under high temperature and pressure using specialized equipment (hot press). It combines the electrical insulation of the film substrate with the strong adhesive force of the adhesive, resulting in a composite film with excellent electrical insulation, mechanical properties, and thermal stability. The upstream supply chain of insulating hot-pressed film is primarily driven by the specialty chemicals industry, which provides matrix resins such as epoxy resin, phenolic resin, and polyimide, as well as reinforcing materials and substrates such as fiberglass cloth and electronic-grade copper foil. The midstream consists of high-end material manufacturers who process upstream raw materials into prepreg and other insulating hot-pressed film rolls through core processes such as precision coating, impregnation, and pre-curing. The downstream directly serves printed circuit board (PCB) manufacturers, semiconductor packaging plants, and new energy equipment companies, using it for the insulation and lamination bonding of multilayer circuit boards, chip packaging substrates, new energy vehicle electronic control systems, and photovoltaic inverters. The demand stems from the accelerated global digitalization and electrification process, including the need for upgrades in the number of high-end PCB layers and material performance for artificial intelligence servers and high-speed

communication equipment, the promotion of reliability and miniaturization of automotive circuit boards by automotive electronics, and the stringent requirements of the green energy industry for the voltage resistance and heat dissipation capabilities of insulation systems in power conversion equipment. The overall market is driven by the dual engines of innovation in the electronic information industry and the energy technology revolution.

The core market drivers of the insulating hot press film can be summarized into three points: Firstly, the wave of new energy and electrification, with the demand for high-reliability and lightweight insulating packaging materials surging for power batteries, energy storage systems, and electric vehicle electronic control units; Secondly, the trend of high-performance and miniaturization of electronic devices, with 5G communication, consumer electronics, and power modules requiring insulating materials to have better thermal conductivity, dielectric strength, and ultra-thin processing capabilities; Thirdly, the upgrading of advanced manufacturing processes, the popularization of automated hot-press packaging technology has driven the demand for standardized, high-efficiency, and highly adhesive sheet-like insulating materials, replacing traditional coating or gasket solutions.
