Inflammatory bowel disease is a group of medical indication that causes chronic inflammation in the gastrointestinal tract. The inflammatory bowel disease mainly comprises of Ulcerative colitis and Crohn's disease. The ulcerative colitis primarily affects the large intestine and anus and it causes the inflammation sores in the inner lining of colon and rectum. The Crohn's disease affects any part of gastrointestinal tract and unlike ulcerative colitis, it affects all the layers of gastrointestinal walls. The ulcerative colitis is more prevalent than that of Crohn's disease. The IBD affects equally in men and women and has prevalence and incidence rates in developed countries than that of developing and under developed countries. The exact cause of inflammatory bowel disease are not well understood however, the combination of several factors such as autoimmune disorders, genetic factors, lifestyle related risks factors such as smoking, sedentary lifestyle, lack of exercise are likely to contribute to the development of symptoms of inflammatory bowel disease. The common symptoms of inflammatory bowel disease includes the severe abdominal cramps and pain, persistent diarrhea, occasional rectal bleeding.

The IBD has no permanent cure and requires the lifelong disease management and treatment. Several medications such as corticosteroids, aminosalicyclates, immunomodulators, and biologic drugs such as TNF inhibitors and up to certain extent antibiotic drugs are prescribed to relive the symptoms of these diseases.
